Why do stormwater discharges from construction need permits?
The construction industry is a crucial participant in Monroe County's efforts to protect our streams, wetlands, ponds, bays, the Genesee River and Lake Ontario. Through the use of erosion and sediment control (ESC) practices, construction site operators are the key defense against erosion and sedimentation. As stormwater flows over a construction site, it picks up pollutants like sediment, debris, and chemicals and delivers them straight to our water resources. These pollutants degrade water quality, aquatic habitat and recreational activities.

Erosion Control and the Stormwater Regulations for the Construction Industry

AVOID THIS: NYS DEC Water Quality Violation
Violation of Article 17 of the Environmental Conservation Law

Preventing soil erosion and sedimentation is an important responsibility on all construction sites.

In addition to the environmental impact, uncontrolled erosion can have a significant financial impact on a construction project. It costs money and time to repair gullies, replace vegetation, clean sediment-clogged storm drains, replace poorly installed ESC practices, and mitigate damage to other people's property or to natural resources.

What is the Stormwater Phase II Program?
Stormwater Phase II is the latest component of the federal 1972 Clean Water Act to come into effect. The Clean Water Act is a set of laws designed to clean U.S. waters and maintain water quality. In New York, the NYS Department of Environmental Conservation (NYS-DEC) implements the stormwater program.

What is required for construction sites?
If your project will disturb one acre of soil or greater, you are required to:

1. Develop a Stormwater Pollution Prevention Plan (SWPPP) & Follow it. The SWPPP is the plan for controlling runoff and pollutants from a site during and after construction activities. The SWPPP must be implemented in order to prevent any water quality violations. Consult the most recent NYS Standards and Specifications for Erosion and Sediment Control (the Blue Book) and the NYS Stormwater Management Design Manual for more information.

2. Submit Notice of Intent (NOI) and obtain a stormwater General Permit. If located in a regulated local municipality a SWPPP Acceptance Form is required. You can request information that explains the permit requirements from either the NYS-DEC or the Monroe County Soil & Water Conservation District. Detailed permit information can be found at the NYS-DEC Stormwater homepage: http://www.dec.ny.gov/chemical/8468.html

3. Certify under penalty of law to follow the SWPPP. Owner/operator and contractors must sign a statement that they understand and agree to comply with the terms and conditions of the SWPPP.

4. Perform required inspections as required. The owner/operator must, on certain sites, hire a Qualified Inspector to perform weekly inspections of erosion and sediment control practices. Reports should determine the level of compliance to water quality standards and specifications in the SWPPP.

5. Maintain erosion & sediment control practices. Correct problems identified by the Qualified Inspector.

6. Keep the SWPPP & all inspection reports on site in a secure location. The SWPPP and inspection reports should be made available to an inspector conducting a compliance inspection during normal business hours.
**Soil Erosion Prevention & Sediment Control**

- Minimize the amount of exposed soil on site
  - Plan the project in stages to minimize the amount of area that is bare and subject to erosion. The less soil exposed, the easier and cheaper it will be to control erosion.
  - Vegeate disturbed areas with permanent or temporary seeding immediately upon reaching final grade or when ceasing activity for 7 or 14 days depending on disturbed acreage.
  - Vegeate or cover top soil and subsoil stockpiles that will not be used immediately.
  - Any site that disturbs more than 5 acres at once requires special permission from NYSDEC or a regulated local municipality.

- Divert clean water away from disturbed soil
  - Interceptors and diversions should be used to direct all water flows away from exposed areas toward stable portions of the site.

- Reduce the velocity of stormwater to reduce erosion rate
  - Vegetated buffers and check dams are erosion and sediment control practices that can be used to slow down stormwater as it travels across and through the project site.
  - Silt fences and other types of perimeter filters should never be used to reduce the velocity of runoff in swales or ditches.

- Protect defined channels immediately with measures adequate to handle the storm flows expected
  - Sod, geotextile, natural fiber, riprap, or other stabilization measures should be used to allow the channels to carry water without causing erosion.
  - Use softer measures like geotextile or vegetation where possible to prevent downstream impacts.

- Keep sediment on site
  - Maintain a 50-foot length of clean stone at construction site access points to accommodate large construction vehicles. Much of the dirt on the tires will fall off before the vehicle gets to the street.
  - Perform regular street sweeping at the construction entrance to prevent dirt from entering storm drains.
  - Do not hose paved areas.
  - Sediment traps and basins are temporary structures and should be used in conjunction with other measures to reduce the amount of sediment.

- Maintain all erosion and sediment control (ESC) practices to ensure their effectiveness during the life of the project
  - Regularly remove collected sediment from silt fences, berms, traps, and all other ESC practices.
  - Ensure that geotextiles and mulch remain in place until vegetation is well established.
  - To protect sensitive areas, use and maintain sediment control structures such as silt fences, diversion structures, and other ESC practices.

---

**Winter Stabilization Recommendations for Bare Soils**

### Mulching Materials

- **Hay or Straw** – Air-dried; free of undesirable (weed) seeds and coarse materials
  - Application rate: 90-100 lbs. or 2-3 bales per 1,000 sq. ft. Two (2) tons or 100-120 bales per acre. Cover about 90% of the disturbed surface area.
  - Mulch anchoring method: Cut mulch into the bare soil surface with the tracks of a bulldozer. Mulch should be “tucked” into soil surface about 3 inches.

### Seed Mix

- **Seed that will germinate after Oct. 1st:**
  - **Winter Wheat**
    - Application: 100 lbs/acre
  - **Winter Rye**
    - Application: 100 lbs./acre
  - **Aroostook Winter Rye**
    - Application: 100 lbs./acre
  - **Tall Fescue, Creeping Red Fescue, or Perennial Ryegrass**
    - Application: 40 lbs./acre

- **Wood Chips** - Air-dried. Free of objectionable course material. Chipped branches, trees, bark, etc.
  - Application rate: 500-900 lbs per 1,000 sq. ft. Apply 10 -20 tons per acre. Application depth should be 2-7 inches.
